

REGULATOR ADJUSTMENT LOCK OUT/TAG OUT (LOTO)

PREVENTS REGULATOR READJUSTMENT

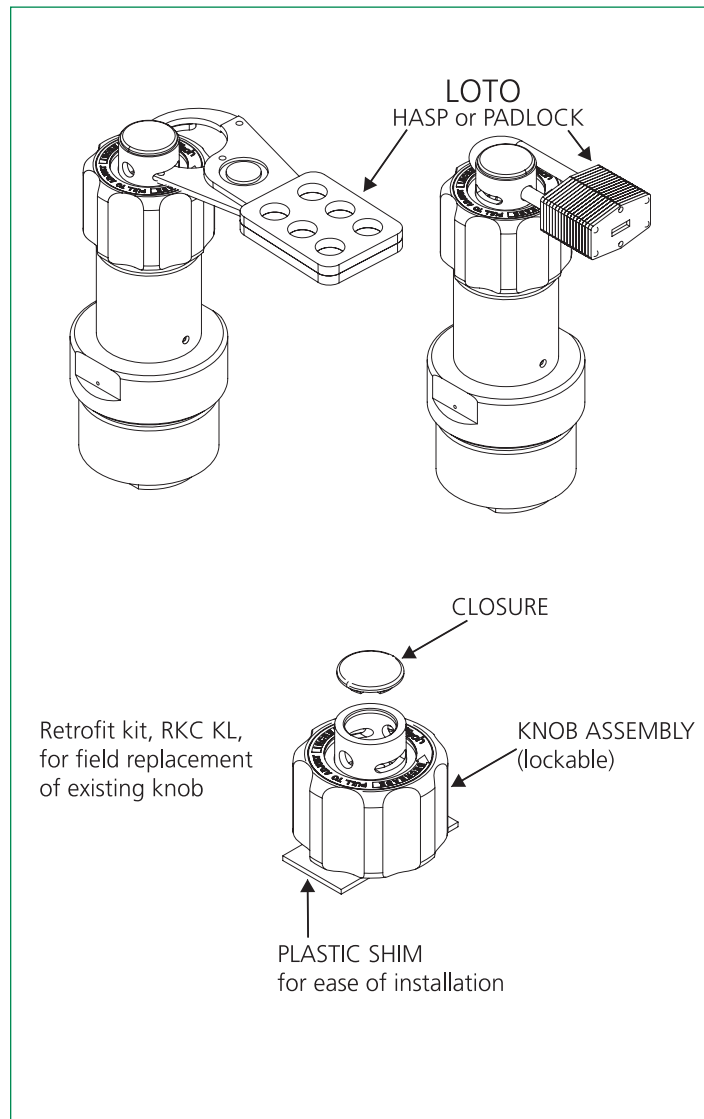

Does Not Close Device

AP KL – Tamper proof knob lock

The KL option, available for most AP Tech pressure regulators, provides two levels of protection against accidental or intentional pressure readjustment. The adjustment knob spins freely until engaged by pulling the knob. Once engaged, the knob will adjust pressure when rotated. Let loose of the knob, it automatically disengages (springs back) to the spin free mode. In the normal, disengaged, position it protects against accidental readjustment. A center hub allows one to either lock with a padlock or hasp to provide LOTO. When locked in disengaged position, the regulator cannot be adjusted.

The KL may be ordered installed on a pressure regulator. It is also available in a retrofit kit, RKC KL, to replace existing, standard knobs.

The KL is available for all regulator models with the exception of preset, AP 20, SL 5200, AP 500, AP 9000, AP 9100, KT 10, KT 12 or switchover regulators.
